

Global Human Sovereign Fund: An Instruction Manual for Everyone

Designer: Yang Shengqi

Completed: May 2026

I. The Uncomfortable Things Around You Are Not Fate; They Are "Illnesses"

Let's not look at the plan right away. Let's first clarify the "illness." You don't need to understand economics; you just need to look around you, look at yourself.

Illness One: Some people win the game at birth.

You surely know someone like this: their house was given by their parents, their job was arranged by their parents, their wedding was paid for by their parents. It's not that they don't work hard, but they don't need to work hard to live well. This isn't just about them; it's a track—wealth and resources are passed down from generation to generation within a small number of families like a relay baton. Your utmost effort might just be someone else's starting point at birth.

Illness Two: Some people are born with debt.

You also surely know someone like this: their parents took on a mountain of debt to buy a house, pay for medical bills, or put them through school. They grow up, and before they can start earning, they have to start paying off debt. They work desperately, but find that wage increases can't keep up with rent hikes, their age is a barrier to changing jobs, and they lack the capital to start a business. They dare not get sick, dare not rest, dare not have children. It's not that they are lazy; it's another track—poverty follows generations like a shadow that won't shake off.

Illness Three: A widening chasm between those two tracks.

You can feel it when you walk down the street: the people in luxury cars and the people riding electric scooters delivering food seem to live in different worlds. It wasn't like this before; the gap wasn't so big. Now, the chasm is still widening. The people in the middle, who once believed that "as long as you work hard, you can change your destiny," now find themselves farther from the mountaintop and closer to the foot of the mountain.

Illness Four: You don't know what you're eating.

You've seen the news about tainted milk powder, toxic face masks, and poisoned bayberries. You've just seen too much and grown numb. Every time something is exposed, there's outrage online for two days, and then people go back to buying,

eating, and using the same things. It's not that you want to be numb; it's that you have no choice. You can't afford the expensive stuff, so you buy the cheap stuff. You suspect the cheap stuff, but you have nowhere to verify it.

Illness Five: The people around you are slowly leaving.

You surely know someone who has sent their child to study abroad, sold their house to emigrate, or is slowly moving their assets out of the country. It's not that they don't love their country; it's that they are afraid. They fear that one day the wind might change direction, and everything they've saved over a lifetime could vanish in an instant. They are not bad people; they just lack a sense of security.

Illness Six: You feel society is getting colder, and trust is diminishing.

Neighbors used to know each other; now, living in the same building, people don't even greet each other. It's not that people have become bad; it's that trust has been used up. One news story after another makes you feel that "the human heart is a thick veil" and "better safe than sorry." You think this is "social evolution," but it's actually "trust bankruptcy."

You might think: "Aren't these things just bad luck? Aren't they just some bad people being unethical?"

No.

These things are not about luck, nor are they about the unethical behavior of a few individuals. Behind them, there is a "system" running. You can't see it, but its logic keeps pushing these things to happen. This system has several "roots":

Root One of the System: Public wealth is "held in proxy" by a few.

The excess profits from monopolized industries (tobacco, oil, electricity, telecommunications) belong, in principle, to all citizens. But in practice, the ownership of this money has always been ambiguous. It is neither the "state's" nor the "people's." It is "held in proxy" by a few. There has never been a channel for this money to be "returned to everyone."

Root Two of the System: Rules have elasticity; enforcement depends on who you are.

Many things are not "impossible to do," but depend on "who is doing them." Some people can easily bypass the rules, while others find it impossible to take a single step. This "elasticity" is not accidental; it is a "backdoor" deliberately left by the system. Its existence makes everyone feel they have a "chance" and also makes

everyone afraid to say "it's unfair."

Root Three of the System: Short-term interests override long-term security.

A five or ten-year plan is too short for a family. A family's aspirations span thirty or fifty years. But the people making decisions in the system only care about "this five years" or "this ten years." They won't repair a flood dam that "might collapse in a hundred years" because they won't live to see that day.

Root Four of the System: Information is filtered layer by layer, and the truth is "structurally forgotten."

Every time something happens, the pattern is: suppress it first, investigate if it can't be suppressed, fix it after the investigation, and then pretend it never happened. It's not that someone is deliberately concealing things; it's that the system's "information filtering" mechanism runs automatically. Once the hype around an incident fades, it becomes "structurally forgotten." Only the victims remember, and only their children remember.

Root Five of the System: "Dialectics" covers everything.

It uses a complex set of rhetoric to say that "we can't do it yet" as "there's no rush," to say that "we haven't managed it well" as "we're working on it," and to say that "we haven't solved it" as "things are stable and improving." This rhetoric is not about deceiving people; it is the protective clothing the system wears for itself.

These "roots" are the true source of the illness.

Everything you see from "Illness One" to "Illness Six" is just the leaves and branches that grew from these "roots."

But in this plan, we will not do any "uprooting."

We will not touch a single thread or needle of the old society. We will not criticize, deny, overthrow, or transform.

We will only do one thing: lay a new path.

The old path continues to operate, and the new path also opens. Those who want to continue on the old path can stay. Those who want to take the new path can walk over.

Between the new path and the old path, there is no conflict, no confrontation, and no one trying to overpower the other.

The name of the new path is the Global Human Sovereign Fund.

It takes the money that belongs to everyone from the "proxy accounts" and places it into a public safe that never closes. Then, every person born on this new path will have their own, inalienable, non-zeroable asset.

You do not need to give up anything on the old path. You only need to walk over.

When enough people walk over, the old path will naturally be abandoned. Not overthrown, but naturally abandoned.

This is "parallel replacement iteration." Without touching a single thread or needle of the old society, it simply offers a better option.

II. Where Does the Money Come From?

This money does not come from deductions from your salary, nor is it from government tax increases. It comes from one place: the excess profits of industries that are the only ones of their kind, with no competitors.

What industries? For example, tobacco, oil, electricity, and telecommunications.

You may not think about these industries often, but you use them every day: smoking, refueling, turning on the lights, using your phone. They share one common characteristic — the state has granted them an "exclusive operating license." What does that mean? It means only they can sell these products or services; others cannot.

This "exclusive operating license" was given up by all citizens. It is precisely because everyone gave up this right that these industries can earn money that others cannot.

Therefore, in principle, logically, and morally, this money belongs to all citizens.

However, in practice, the ownership of this money has always been ambiguous. It is neither the "state's" nor the "people's." It is "held in proxy" by a few.

What this plan intends to do is to take this large sum of money out of the "proxy accounts" and place it into a public safe that never closes.

How large is this sum of money? So large that no individual, no institution, and no country can ignore it. It is the foundation of this new path.

Note: This action is not "expropriation," not "nationalization," and not "wealth redistribution." It is called "restitution." Restitution of a public wealth that has been held in proxy for a long time but has never truly been returned.

III. How to Lock This Safe Box?

To prevent this safe box from being stolen, robbed, or having its rules changed, it uses a "Triple Lock." These three locks are not visible to the average person. They are designed deep within the institutional structure, but their protective effect can be felt by everyone.

The First Lock: Locked by the Highest Law

This safe box must be established by a "constitutional law." What is a "constitutional law"? It is a law that is superior to and more difficult to change than ordinary laws. No government, institution, or individual can use administrative orders to touch the money inside. To change the rules? It requires a two-thirds majority vote in parliament, plus a popular referendum. This threshold is so high that it is virtually impossible.

Why must it be like this? Because history has proven that administrative orders can be revoked by subsequent administrative orders, and ordinary laws can be modified by a sufficiently large political force. Only constitutional law—although not completely unchangeable—has a modification threshold so high that anyone trying to shake the safe box must trigger a full-scale constitutional crisis to succeed. This cost itself is the most powerful defense.

Core provisions that must be written into the law:

- The legal status, name, and place of registration of the safe box.
- The list of founding assets and the procedure for transferring ownership.
- The scope of beneficiaries and the criteria for determining eligibility.
- The independence of the governance structure and the selection mechanism.
- The professional nature of investment decisions and the principle of non-interference.
- The standards and frequency of information disclosure.
- The criminal and civil liability clauses for violating the independence of the safe box.
- The procedure for modifying the safe box's rules.
- The conditions for dissolving the safe box.

All of these must be written into the law verbatim.

The Second Lock: Locked by Physical Separation

This safe box is not located on the territory of any single country. Its legal place of registration is chosen to be Hong Kong. Why Hong Kong? Because Hong Kong is the only place with "One Country, Two Systems" and has an independent common law system. The common law tradition of precedent, judicial independence, and the inviolability of property rights are the shared legal language of global financial centers. For foreign investors, placing money in a safe box protected by Hong Kong law and under the mainland Chinese legal framework represents a completely different level of trust.

Its assets are not deposited in the central bank of any country. They are held in custody by several of the world's most secure independent banks, dispersed across different international financial centers. The founding country's government, military, and judicial system have no power to freeze, query, or appropriate this money.

What does this mean? It means that even if your country experiences a coup, a war, or a change of government, this money remains safe. Because no one can physically touch it. It's like depositing your money in a Swiss bank; the Swiss bank would not hand your money over to a new government just because your country's leader changed.

Furthermore, there is an additional layer: If the decision-making body and management of the safe box accept or execute investment instructions from the founding country, it constitutes a breach of fiduciary duty. They will face civil lawsuits in the court of the place of registration and bear personal legal liability globally. No external party can interfere with the safe box's investment decisions through "orders."

The Third Lock: Locked by "Three Immutable Rules"

There are three rules that can never be changed. Even the procedure for modifying the constitutional law cannot touch them. They are the "steel skeleton" of the safe box.

Rule One: Perpetual Lockdown of Initial Capital.

Once funds injected into the safe box are designated as "initial capital type," they are permanently locked. No country, institution, or individual can demand a return of the funds. The injection is irreversible. This rule prevents anyone from "injecting first, then backing out," using the safe box as a short-term financing tool.

Rule Two: Non-Deprivation of Beneficiary Status.

No person's right to benefit can be deprived due to their political stance, religious belief, change of nationality, or even because they have committed a crime (unless the crime directly harms the safe box itself). A prisoner in jail will still receive their dividend next month. The right to benefit is a civil right, completely separated from political rights and personal liberty.

Why must it be like this? Because if the right to benefit can be deprived on political grounds, the safe box becomes a new "tool of power." It must be completely independent of any political judgment to truly be "non-deprivable."

Rule Three: Independence of Governance.

The investment decisions, distribution rules, and personnel appointments of the safe box are not subject to directives from any country, government, political party, institution, or individual. Any attempt to modify the independence of governance is unconstitutional.

Why must it be like this? Because if governance is not independent, all the previous locks are meaningless. As long as someone can "order" the safe box on how to invest, they can indirectly control the safe box's assets through investment instructions.

These three locks together form the "steel skeleton" of the safe box. They are not isolated; they reinforce each other:

- First Lock: Makes the legal cost of attacking the safe box extremely high, requiring constitutional-level force.
- Second Lock: Removes the physical interface for attacking the safe box—no backdoors, no proxy holding, no residual control rights.
- Third Lock: Renders physical means of attack ineffective—assets are abroad, laws are abroad, governance is abroad.

Three locks simultaneously secure the same door. If any single lock is breached, two others remain. The prerequisite for all three locks to be breached simultaneously is the collapse of domestic political power, the international legal system, and the global financial order all at once. This level of catastrophe is beyond the scope of this plan's prevention.

IV. Eleven Firewalls: Compressing Human Discretion to the Absolute Minimum

The Triple Lock secures the door to the safe box, preventing outsiders from stealing, robbing, or changing the rules. But locking the door is not enough, because there are still people operating inside—the fund managers, investment advisors, and custodian banks. They hold "discretionary power" and can, within the permitted rules, act in their own interest rather than that of the ordinary person.

To compress this "human operational space" to the absolute minimum, the safe box is designed with "Eleven Firewalls." Each firewall is independent and cannot be bypassed. They seal off all possible "paths for cheating" at every level: source, process, execution, supervision, and personnel.

Firewall One: Matrix Independent Account System

This safe box does not have a single "unified account" or a single "unified management layer." It adopts a "Matrix Independent Account System" — each type of asset, each market, and each currency is registered as a separate legal entity. Each entity has its own independent board of directors, independent management team, independent risk and compliance team, and independent external auditor.

- Equity Account System: Sub-divided by country and by market.
- Bond Account System: Sub-divided by currency and by region.
- Hedge Account System: Completely parallel to the equity and bond accounts, registered independently.
- Commodity Account System: Independently allocated to global commodities and physical assets.

All capital flows between accounts are executed by a completely independent "System Rebalancing Hub." Furthermore, there can be no personnel overlap of any kind between the management teams, board members, risk officers, and external auditors of any two accounts.

If someone tries to cheat, they would have to simultaneously bribe dozens of independent directors, buy off several different audit firms, and coordinate multiple completely isolated management teams. This is harder than directly breaching a national central bank.

Firewall Two: Mandatory Hedging for Each Group

Any account group must maintain a corresponding hedge position. If an equity account buys shares in Company A, it must simultaneously hold a corresponding

"reverse instrument" to hedge against downside risk. This design is not for profit, but to "mandatorily achieve risk neutrality." It prevents traders from using "directional bets" to chase short-term excess returns, forcing them to stick to long-term allocation.

Firewall Three: Ten-Year Deferred Performance Compensation

At least 50% of a trader's annual bonus cannot be taken immediately. It must be deferred in the form of "safe box shares" with a deferral period of no less than 5 years. If a trader leaves during the deferral period or is fired for misconduct, the unvested deferred shares are forfeited entirely and revert to the safe box's public benefit pool.

This means the trader's interests are tightly locked with the safe box's long-term interests. They cannot engage in short-term speculation, as it would cost them 50% of their bonus. They cannot act recklessly, as they fear being fired and losing all unvested shares.

Firewall Four: Basket Currency Proportional Allocation

The safe box's assets must be globally diversified, meaning its "currency exposure" cannot be tied to any single currency. Its currency allocation must anchor to four sets of globally recognized data:

1. Trade weights from the Bank for International Settlements (BIS).
2. Special Drawing Rights (SDR) weights from the International Monetary Fund (IMF).
3. Market transaction weights from CLS and SWIFT.
4. Economic and geopolitical composite indicators, including GDP and global reserve currency shares.

None of these four data sets can be manipulated by any single country. The safe box's currency allocation is jointly determined by them.

Firewall Five: Asset Class Proportional Allocation

The safe box's capital cannot be invested arbitrarily; it must follow a fixed set of proportions:

- Global Equities: 60% to 70% (long-term growth engine)
- Global Bonds: 20% to 30% (stabilizer and ballast)
- Cash and Equivalents: 1% to 5% (liquidity reserve)

- Hedge Instrument Portfolio: 5% to 10% (systemic risk protection)

This ratio is not arbitrary; it is the optimal risk-reward solution derived from long-term calculations. It locks the safe box's risk structure—regardless of market changes, its underlying risk remains controllable.

Firewall Six: Statutory Fee Cap

The total management fee rate of the safe box is legally capped at 1% per annum. This means that even if the trader team grows larger and more elite, they cannot increase the management fee beyond 1%. This is a direct wall limiting "fees."

Firewall Seven: Single-Country Market Weight Constraint

The total asset holdings in any single country cannot exceed 20% of the safe box's net asset value. This means the safe box cannot be "wiped out" by the economic fluctuations of any one country. Even if that country collapses, the safe box's maximum loss is limited to 20%.

Firewall Eight: Hard Constraints on Investment Targets

The safe box can only invest in "safe" targets.

- Bonds: Credit rating must be at least A-grade.
- Equities: Must meet at least one of three criteria: high dividend (stable payout), high growth (growth potential), or high liquidity (active trading).
- Junk stocks, junk bonds, and high-risk derivatives are strictly prohibited.

Firewall Nine: 5% Active Talent Reserve

Firewall Eight imposes strict limits on investment targets. However, being too strict can cause the safe box to miss truly outstanding but temporarily non-compliant high-potential enterprises. Therefore, this firewall leaves a "small opening" — each account group can allocate up to 5% of its capital as an "Active Talent Reserve." This 5% can be exempted from the restrictions of Firewall Eight to invest in high-potential but high-risk targets. This firewall allows the safe box to balance "absolute safety" with "moderate aggression."

Firewall Ten: Mandatory Separation of Hedge and Equity Accounts

Hedge instruments (such as options, futures, swaps) cannot be mixed in the same account as equities. They must be physically isolated and legally independent. This means a trader cannot use capital from an equity account for high-leverage hedging operations. They must operate through another independent account,

with the profits and losses of the two accounts calculated separately.

Firewall Eleven: Allocation Constraints for Zero-Yield Assets like Gold and Bitcoin

Zero-yield assets such as gold and Bitcoin do not generate interest or dividends. They can only be allocated to hedge accounts and commodity accounts, and cannot enter equity or bond accounts. Furthermore, their total allocation cannot exceed 2% of the safe box's total assets. This prevents anyone from turning the safe box into a "casino"—betting on gold rising or Bitcoin falling. The 2% limit allows their existence but ensures they do not affect the overall portfolio.

Final Effect of the Eleven Firewalls:

The eleven firewalls, layered progressively, compress human operational space to the absolute minimum.

- The first five firewalls lock down the "asset structure" and "personnel interests."
- The sixth through eleventh firewalls lock down "investment targets" and "operational authority."

When all eleven firewalls are in place, a trader's "discretionary power" is reduced to only one thing: executing the algorithmic operations within a framework that has already been locked, allocated, and restricted. They no longer have the space to "decide the direction based on personal judgment." They become an "executor," not a "decision-maker."

This is the ultimate substitution of "firewalls" for people.

V. Trader Constraints: Make Money Managers Sail in the Same Boat as Ordinary People

The eleven firewalls alone are not enough, because firewalls are "dead." They can only block "illegal operations," not "legal but selfish" operations.

What are "legal but selfish" operations? It means a trader follows all the rules, but every decision they make serves their own short-term interests, rather than the long-term interests of ordinary people.

To block this "legal but selfish" operational space, the safe box imposes seven constraints on traders (those responsible for day-to-day investment management). The core of these seven constraints is one sentence: Make traders share the risk

with ordinary people, rather than just sharing the returns.

Constraint One: Compensation Deferral Mechanism

At least 50% of a trader's annual bonus cannot be taken immediately. It must be deferred in the form of "safe box shares" with a deferral period of no less than 5 years. This is like receiving half of your year-end bonus today, while the other half can only be withdrawn after five years. Furthermore, if a trader leaves during the deferral period or is fired for misconduct, the unvested deferred shares are forfeited entirely and revert to the safe box's public benefit pool.

This means: A trader's interests are tied to the safe box's long-term interests. They cannot engage in short-term speculation, as it would cost them 50% of their bonus. They cannot act recklessly, as they fear being fired and losing all unvested shares.

Constraint Two: Mandatory Co-Investment Obligation

A trader must invest 10% to 20% of their personal investable assets into the safe box under the same conditions as ordinary people. This money, like ordinary people's money, is locked until age 60. If a trader wishes to withdraw it early before leaving the position for 5 years? Not allowed. Only after leaving the position for 5 full years can this money be unlocked.

This means: The trader puts themselves in the same "trench" as ordinary people. They are not managing money "on behalf" of ordinary people; they are investing money "together with" ordinary people. If the safe box profits, they profit together. If the safe box loses, they lose together. They have no reason to take unnecessary risks.

Constraint Three: Prohibition of Hedging

Traders and their immediate family members are prohibited from conducting any form of hedging transaction against the safe box's holdings. What is "hedging"? It is a reverse transaction. For example, if the safe box buys shares in Company A, the trader secretly "shorts" Company A in their personal account—so when the safe box loses money, they personally profit.

This firewall completely prohibits this behavior. Any discovered hedging operation will result in the confiscation of the trader's entire deferred compensation and co-invested funds.

Constraint Four: Post-Employment Cooling-Off Period

After leaving their position, a trader cannot join any asset management institution

directly competing with the safe box for 2 years. If this rule is violated, their unvested deferred shares and co-invested funds are all forfeited.

This firewall prevents: A trader from accumulating experience at the safe box and then jumping to a competitor, using the safe box's investment strategies to help the competitor profit.

Constraint Five: Performance Benchmark Constraint

A trader's compensation is not tied to "short-term performance" but to "long-term performance." The assessment period is a 3-year rolling window. This means that how much they earned this year is not important; it is their average performance over the past 3 years that matters. Short-term excess returns are not included in bonus calculations.

This firewall prevents: A trader from chasing a high-risk, high-return asset just to earn this year's bonus, thinking, "If I win, I get the bonus; if I lose, I quit, and I've already taken the bonus."

Constraint Six: Personal Transaction Declaration

All personal securities transactions of a trader and their immediate family members must be declared to the safe box's compliance committee. No private investments can be concealed.

This firewall prevents: "Front-running"—a trader using inside information to buy or sell before the safe box does.

Constraint Seven: Lifetime Accountability Clause

If a trader, during their tenure or after leaving, is found to have committed fraud, insider trading, or self-dealing during their time at the fund, the safe box has the right to pursue recovery of their entire compensation—including previously paid portions—and all investment gains, for their entire lifetime.

This means: Traders cannot assume that "leaving the job means being safe." If they do something wrong once, this debt will follow them for life. It will be pursued until they die.

Final Effect of the Trader Constraints:

These seven constraints transform a trader from an "agent who can run away and shift blame at any time" into a "partner tied to everyone on the same boat."

They cannot act recklessly, because the cost of recklessness far exceeds the

potential gain. They cannot slack off, because their personal co-invested funds are also shrinking. They cannot hide anything, because the consequence of concealment is lifetime accountability.

These seven constraints do not rely on morality or preaching. They rely on "the knife of interest pressed against the throat." When a trader's interests are completely tied to ordinary people's interests, they will naturally manage money well.

VI. Beneficiary Rights Rules: What Is Yours Is Yours, No One Can Take It Away

The money in the safe box does not belong to the "state" or any "institution." It belongs to every specific individual. To ensure that this right "belonging to everyone" cannot be taken away, sold, or robbed by anyone, the plan designs six "Beneficiary Rights Rules." These six rules are the most direct "protective layer" that ordinary people can feel.

Rule One: Non-Deprivation of Beneficiary Rights

Your beneficiary right cannot be deprived due to your political stance, religious belief, change of nationality, or even because you have committed a crime (unless the crime directly harms the safe box itself).

What does this mean? It means that a person serving a prison sentence will still receive their dividend next month. A person who openly criticizes the government will still receive their dividend next month. A person who emigrates abroad, as long as they were once a legal beneficiary, will still receive their dividend next month.

The beneficiary right is a "civil right" and is completely separate from your "political rights."

Why must it be like this? Because if the beneficiary right can be deprived on political grounds, the safe box becomes a new "tool of power." It can be used to "reward the obedient and punish the disobedient." Once it becomes that, it loses its "non-deprivable" essence and is no longer "everyone's safe box." Therefore, this rule is the bottom line within the bottom line.

Rule Two: Non-Transferability of Beneficiary Rights

Beneficiary rights at any level cannot be sold, mortgaged, pledged, or traded in the secondary market. Any transfer agreement you sign during your lifetime is not

recognized, executed, or registered by the safe box.

This firewall prevents: Someone from packaging beneficiary rights into financial products and selling them in the market; someone from using beneficiary rights as collateral for loans; someone from monopolizing beneficiary rights and turning them into a tradable "commodity." When beneficiary rights can be bought and sold, they return to the old path of being held by "a few people."

Rule Three: No Coerced Transfer of Beneficiary Rights

Anyone who attempts to influence your will or secondary beneficiary designation through coercion, fraud, or other criminal acts—once verified—will result in the termination of the relevant beneficiary rights, and they cannot be reapplied for.

This firewall protects the most vulnerable people: the elderly, the sick, and those with less education. If someone forces you to write a will or designate them as a beneficiary, the act itself will void your beneficiary rights. This rule makes those who try to "bully" others into giving up their beneficiary rights afraid to act.

Rule Four: The Only Legal Channels for Transferring Beneficiary Rights – Will or Secondary Beneficiary Designation

Beneficiary rights can only be transferred to others through two methods:

Method One: Secondary Beneficiary Designation.

When you open your personal account, you can designate one or more secondary beneficiaries. This designation can be modified in the system at any time, without reason, without notarization, and is valid for life. If something happens to you, the account will automatically transfer to your designated person without any lawsuits.

Method Two: Inheritance by Will.

You transfer your beneficiary rights to others through a legal will. The will must undergo an independent review by the safe box's compliance committee to confirm that there is no coercion or fraud before it takes effect.

These two channels are the only legal methods of transfer. There is no "private sale," no "mortgage," no "trading."

Rule Five: Non-Deprivation of Beneficiary Rights – Only Dividends Can Be Inherited, Not Principal

After you pass away, your child can inherit your account, but they do not inherit the "principal" in the account. The principal always belongs to the safe box and cannot be withdrawn. What they inherit is the "right to dividends." This means

your account continues to operate, and dividends will be paid into their account each year.

This design ensures that the safe box's principal is never fragmented. If everyone withdrew the principal, the safe box would be empty, and future generations would have nothing to share. Therefore, the principal is "perpetual," and only the dividends are "inheritable." In this way, after you pass away, your account continues, and your child also has a safety net.

Rule Six: Age Reset Rule for Generational Inheritance

If a child inherits an account, their dividend distribution does not begin immediately upon inheritance. It must wait until they themselves reach the designated age (e.g., 18 or 60). However, the rule here is: the dividend rights of the account take effect immediately upon inheritance, but the actual payment age follows the child's own attainment of the designated age. If they have not yet reached the designated age, the dividends from the inherited account continue to accumulate in the account until they reach the designated age, at which point they are distributed in a lump sum or in installments.

This firewall prevents: Someone from transferring an account to an infant, allowing the infant to receive dividends immediately—such a loophole must be sealed. Only when you personally reach the age eligible for dividends can you receive them. Your child must also wait until they reach the eligible age to receive dividends.

Final Effect of the Beneficiary Rights Rules:

These six rules transform the beneficiary right of every ordinary person into a "purely personal right" that is non-deprivable, non-transferable, non-coercible, and legally inheritable.

It is yours. It is yours. No one can take it away using political power. No one can buy it with money. No one can force you to hand it over through violence.

It is your most certain, most unshakeable "bottom card" on this new path.

VII. Tiered Account System: Everyone Can Board, Each Chooses Their Seat

This safe box is not a "single pot" where everyone shares the food. It is a "train station" with trains heading in different directions. You choose which train to board. Whether you have a lot of money or a little, you can board—just in a different seat.

The safe box's account system is divided into several tiers. Each tier has its own "lock-in rules" and "benefit attribution." You only need to know: which category you fall into, how your money will be locked, and how dividends will be distributed.

Tier One: National Fund Type

This type of account refers to the portion of money that a country voluntarily chooses to lock as "shared by all citizens" when the safe box is established or when funds are subsequently injected. Once injected, this money is permanently locked. The country cannot take it back or divert it for other purposes. The returns on this money belong to all citizens and are distributed equally on a per capita basis, paid into each individual's personal account annually.

What does this mean? It means that a country can choose to place a portion of its funds "permanently" into the safe box, making this money the "shared asset" of all people. No one can touch this money; only all citizens can share its returns. This is the "most fundamental, safest, and most enduring" portion of the safe box's capital, and the most direct "benefit" that ordinary people can feel.

Tier Two: National-Level Investment Account

A country can also choose another type of account: not permanently locked, but locked for a fixed term (e.g., 10 years). After the lock-in period expires, the country can withdraw funds in installments. The returns from this account belong to the national treasury and are used for national needs.

This type of account serves as a "flexible supplement" to the "National Fund Type," giving the country a certain degree of flexibility—it can both permanently entrust a portion of its funds to its citizens and keep a portion for flexible use.

Tier Three: Social Security Account

Funds injected by the national social security system, specifically designated for pensions and healthcare. These funds are permanently locked and cannot be withdrawn. Their returns belong to the social security fund and are used to pay pensions and reimburse medical expenses for insured individuals.

This type of account is designed to address issues like "insufficient pensions" and "difficult medical reimbursements." It frees social security from reliance on "fiscal subsidies" by providing it with a permanent, independent source of funding.

Tier Four: Institutional Account

Enterprises, funds, labor unions, cooperatives, religious organizations, and other legal entities can open this type of account. They can choose their own lock-in period (recommended no less than 5 years). Funds cannot be withdrawn during the lock-in period. After the lock-in period expires, funds can be unlocked in installments. Returns belong to the institution itself.

This type of account allows institutions to participate and benefit from the safe box's long-term compound returns. It is not for "individuals" but for "organizations."

Tier Five: Personal Account

This is the type of account most directly relevant to you.

From the day you are born, you automatically possess a personal account. You do not need to deposit money, apply for it, or do anything. It exists automatically. The principal in this account is locked until you reach age 60. It cannot be withdrawn, mortgaged, or sold. However, dividends begin to be distributed from the first year of your birth and are paid into your account annually.

At age 60, you can decide for yourself:

- Keep it in the safe box and receive dividends annually.
- Withdraw it in installments.
- Or leave it to your designated person through a will.

Simply put: While you are working, this money helps support you. When you retire, this money helps support your old age. It will not make you rich, but it will ensure you never have to worry about "going hungry."

Tier Six: Family Account

A family (e.g., a surname, a large household) can apply to open a family account. The principal in this type of account is permanently locked and cannot be withdrawn, but it can be inherited perpetually—when you pass away, your child inherits; when your child passes away, their child inherits. Its returns are distributed within the family as they decide.

This type of account is for those who want their family legacy to continue forever. If you do not want your money to be squandered, and you do not want your descendants to be without protection, you can inject a sum of money into a family account, letting it pass down through generations.

Tier Seven: Local Government Account

Local governments (e.g., a city, a county) can also open accounts. They can set their own lock-in period (recommended no less than 5 years). Funds cannot be withdrawn during the lock-in period but can be withdrawn after it expires. Returns belong to the local treasury and are used for local public expenditures.

Tier Eight: Charitable Account

Charitable organizations (e.g., the Red Cross, environmental protection organizations) can open this type of account. Their principal is also locked (recommended no less than 10 years). Returns belong to the charitable organization and are used for public welfare.

This type of account provides charitable organizations with a permanent source of funding, freeing them from relying on "the goodwill of donors."

Tier Nine: International Organization Account

International institutions such as the United Nations, the World Bank, and the World Health Organization can also open accounts. The lock-in period for these accounts can be customized. Returns belong to the international organization and are used for global public goods—such as climate change, pandemic prevention, and poverty alleviation.

Supplementary Notes on the Account System:

If a country chooses "high lock-in" (placing most of its funds into the National Fund Type), its citizens will receive more dividends. If a country chooses "low lock-in," its citizens will receive fewer dividends. But this choice lies with the country, not the safe box's mandate. The safe box's rule is: you can choose "what proportion to lock," but once locked, you cannot reverse it.

For individuals, you only need to know: you have a personal account, existing from birth. You do not need to do anything for it. Each year, it will pay dividends into your account until you leave this world. It does not require you to "earn" it or "fight" for it. It is simply there.

Final Effect of the Tiered Account System:

This system allows everyone to find their "seat."

- If you are an ordinary person: You have a personal account, receiving dividends from birth, with the freedom to manage it after age 60.

- If you are a family: You have a family account, allowing wealth to pass down through generations.
- If you are an institution: You have an institutional account, allowing you to enjoy long-term compound returns.
- If you are a charitable organization: You have a charitable account, providing perpetual funding.
- If you are a country: You have two choices: the National Fund Type (permanent lock-in, shared by all citizens) or the National-Level Investment Account (flexible term, for national use).

Everyone can board, each choosing their seat. No one is excluded, and no one is forgotten. This is the meaning of the "Tiered Account System"—a system that embraces everyone but does not allow anyone to control everyone.

VIII. Immunity Mechanism Against Violent Seizure: Even With a Gun, You Can't Take It

You might still worry: What if someone doesn't follow the rules and directly sends troops to storm the safe box and take the money? Or what if someone launches a coup, changes the government, and then declares that the safe box's money belongs to the new government?

This plan does not rely on "force" to protect the safe box. It relies on a "Four-Layer Immunity Mechanism." These four layers of immunity make it impossible for anyone attempting to seize the safe box by violence to find a reason to act, or a way to survive after acting.

Layer One: Soldiers Won't Follow — Because Their Families Also Receive Dividends

If a general wants to send troops to seize the safe box, they will face a fundamental problem: the soldiers under their command—their parents, wives, and children—all receive dividends from the safe box. The soldiers will ask: "General, my parents' pension is in that safe box. You want me to go rob my parents' money?" No general can answer that question.

When the survival baseline of hundreds of millions of families is anchored in the safe box, any act of violent seizure is not a "declaration of war against the government," but a "declaration of war against hundreds of millions of families." And hundreds of millions of families cannot be suppressed by violence.

Layer Two: Wealth Cannot Be Physically Looted — Because the Assets Are on the Other Side of the Planet

Even if a small group of desperadoes successfully breaks into the "physical location" of the safe box, they will find: there are no gold bars, no cash, no stock certificates inside. All assets are in the form of "electronic certificates," held in custody by dozens of independent banks around the world. These banks are spread across Europe, North America, and Southeast Asia, under different legal jurisdictions.

Even if you control the safe box's place of registration, you cannot control those custodian banks. Even if you control those custodian banks, you cannot "transfer" the assets to your name—because every transfer requires multiple signatures, and at least one of those signatures is held by the independent "System Rebalancing Hub," whose location you cannot even determine.

Layer Three: Legitimacy Cannot Be Established — Because All Citizens See the Safe Box as Their Lifeline

If someone does seize "legal control" of the safe box by force, they will face an even bigger problem: they cannot establish "legitimacy." The safe box is not the property of any government; it is the property of all citizens. When someone seizes it by force, they are not facing a "previous government," but "all citizens." The citizens will see them as a "robber," not a "new master."

In history, all violent seizures ultimately required some form of "legitimacy" to maintain rule—whether it was "inheriting the orthodox lineage" or "mandate of the people." But the legal owner of this safe box is "all citizens." And all citizens will not recognize someone who robbed their life-saving money by force as the "legal master." Therefore, the violent seizure faces not a "previous regime" that can be bought, but "all citizens" who cannot be bought.

Layer Four: External Isolation — The Violent Regime Will Face Comprehensive International Sanctions

When the safe box is registered in a rule-of-law-based international financial center (Hong Kong), its legal status is protected by international law. If a regime seizes control of the safe box by violent means, it will immediately face:

- Injunctions from the court of the place of registration.
- Freezing of assets by global custodian banks.
- Comprehensive sanctions from the international financial system.

- Collective countermeasures from all countries that have signed investor protection agreements.

This means: what the violent seizure gets is not a "safe box full of money," but a "fate of being isolated by the world." They cannot get the money because they cannot transfer those custodian assets out. They cannot buy anyone off because they have already been cut off by the global financial system. They cannot even maintain basic economic operations because they have become "pariahs" of the international community.

Summary of the Immunity Mechanism Against Violent Seizure:

These four layers of immunity together form a "violent immunity barrier":

- Layer One: The military will not follow, because soldiers' families are also beneficiaries.
- Layer Two: The money cannot be taken because it is on the other side of the planet.
- Layer Three: Legitimacy cannot be established because all citizens see the safe box as their lifeline.
- Layer Four: External isolation, as the international community will impose comprehensive sanctions.

When these four layers of immunity work together, anyone attempting to seize the safe box by violence will find: they are not facing a door guarded by soldiers, but a "labyrinth without a door." They cannot find the target, the tools, or the allies. This is the true meaning of "violent immunity"—it renders violence itself meaningless.

IX. Doomsday Clause: Even If the Country Ceases to Exist, Your Account Remains

You might think the word "doomsday" is too distant, but historical regime changes and national collapses are not rare. The Soviet Union is gone, Yugoslavia is gone, and countless small families have disappeared in the flames of war. If the country you live in experiences such an event one day, what will happen to your safe box account?

This plan specifically designs a set of "Doomsday Clauses" for this scenario. Its core is one sentence: The institution does not perish; the account does not perish.

Layer One: Principle of Institutional Indestructibility

The governance structure and asset attribution of the safe box do not change due to the existence or demise of any country. Even if your country disappears, the safe box still exists. Its legal place of registration, custodian banks, and governance structure will not automatically become invalid due to the demise of a country.

This means: The safe box was designed from the very beginning not to bind its fate to that of any single country. It is an "independent existence," not an "appendage of a country."

Layer Two: Protection of Personal and Family Accounts

If a country ceases to exist, your personal account will not disappear. It will automatically convert into a "Refugee Account." What is a "Refugee Account"? It is an "account for a global citizen" without nationality or national affiliation. You do not need any country to recognize your identity; you only need to prove that you were once a legal beneficiary—your right to benefit remains valid, and dividends are still paid normally.

Your family account is the same. The family does not depend on the country for its existence, and the family account will not disappear because the country ceases to exist.

Layer Three: Disposition Path for National and Social Security Accounts

If a country ceases to exist, how will the "National-Level Investment Accounts" and "Social Security Accounts" originally belonging to this country be handled? The rule stipulates: their returns shall be prioritized for humanitarian assistance to the original citizens—for example, providing food, medical care, and shelter to those displaced by the collapse of the country. This is the final social value of this money after the "demise of the country."

Layer Four: Non-Recognition Rule for Competing Regimes

If a country experiences a situation with "two competing regimes"—for example, a government-in-exile and a de facto controlling government—both claiming to be the "legitimate representative," how will the safe box handle it? The rule stipulates: In this situation, the safe box will suspend dividend distributions for national-level accounts and transfer the funds to an independent international third party (such as the United Nations or the International Red Cross) for custody, until the international community reaches a consensus on which regime is the legitimate representative.

This rule prevents the safe box from being exploited by one side during a "civil

war."

Layer Five: The Channel Does Not Perish

Finally, the most critical rule: Regardless of how many countries perish, and wherever refugees are scattered, as long as the safe box itself exists, the distribution system will continue to operate. No regime, government, or international organization has the authority to close the channels through which beneficiaries receive their payouts.

This means: Even if the world order is rebuilt, borders are redrawn, and regimes change countless times, your account remains. You only need a "proof of identity" to demonstrate that you were once a legal beneficiary. This proof is stored in the safe box's system and can be verified anywhere in the world.

Final Effect of the Doomsday Clause:

This set of Doomsday Clauses turns the safe box into a "perpetual motion machine beyond nations." It does not rely on the stability of any country, the continuation of any regime, or the integrity of any international order. It relies on only one thing: itself.

Therefore, when "doomsday" truly arrives, ordinary people will not lose everything because their country collapses. Their account remains, their money remains, and their survival baseline remains. The country may perish, the regime may change, the government may fall, but that "safe box belonging to everyone" will continue to operate.

X. Appendix: Thirty Years Later, Even "People" Will No Longer Be Needed

The main plan is complete. But you might think: These designs are indeed very rigorous, but at their core, it is still "people" managing things—the board members, the traders, the custodian banks, the compliance committee. They are still people. As long as there are people, there will always be ways to bypass the rules, ways to collude, and ways to slowly pry open a door over the long years.

You are right. Therefore, besides the main plan, there is an "Appendix." It describes what happens when this safe box has been running for thirty years: we can remove "people" entirely.

Why Thirty Years?

Thirty years is the span of one generation. The first batch of beneficiaries born

after the safe box's establishment will have reached the age of thirty. They have been receiving dividends since birth. They know that this safe box is not a "government handout" but their "right." They will not allow anyone to destroy it.

Thirty years is also the period for technological maturity. By then, technologies such as blockchain, smart contracts, and distributed ledgers will be mature enough to support a global-scale, automated, and immutable asset management system.

Thirty years is also the time when the "founding team" will have exited the historical stage. When the people who initially pushed this plan gradually grow old, retire, or pass away, the safe box should no longer rely on the will of any "person" to sustain itself. It should run on its own.

What Happens in Thirty Years?

A transition from "human governance" to "code governance."

What is "code governance"? It means converting all the safe box's rules—dividend algorithms, investment strategies, asset allocation, account management, compliance reviews—into code. This code is placed on a public blockchain, where anyone can view it and verify it.

Benefits of Code Governance:

1. **Unforgeable:** No one can alter the code unless they control more than half of the global computing power.
2. **Unbuyable:** Code does not accept bribes, cannot collude, and cannot lie. It only executes the rules written into it.
3. **Undeceivable:** All transaction records are publicly available on the chain, and anyone can verify them.
4. **Unstoppable:** As long as the internet exists, the code will continue to run.

One Situation Where Code Cannot Fully Replace People:

When the safe box faces an unprecedented "black swan" event that the code has not been programmed to handle—such as an asteroid impact, an out-of-control AI attack, or a global network blackout—a group of "people" rather than a line of "code" is needed to make a judgment.

Therefore, the plan retains an "Ultimate Emergency Response Mechanism," leaving one "human intervention interface." However, the authority of this interface is strictly restricted: it can only be used for "shutdown," not for "modification."

When You Press the "Switch" Button Thirty Years Later:

You no longer need to trust anyone. You no longer need to trust the government, the traders, the board of directors, or even your future self. You only need to trust the code written on the public ledger, witnessed by global computing power, and immutable.

- The "legal chains" will be replaced by "code chains."
- The "physical isolation" will be replaced by "computing power isolation."
- "Human supervision" will be replaced by "algorithmic verification."

The Final Meaning of This Appendix:

- The main plan states: The system must be such that people cannot destroy it.
- The appendix states: The system itself should exist as only code.

When this safe box has run for thirty years, it will have evolved from "human governance" to "code governance"—it will no longer require anyone's trust, anyone's supervision, or anyone's maintenance. It will become an independent, automated, eternal, and entirely code-driven global public asset management protocol.

And your account will remain inside.
